reMarket - A Community Marketplace

reBuy wants to offer a merchant marketplace where customer can see, rate and buy offers. As a developer at reBuy, you have a lot of freedom but need to take decisions with your team on how to build the product. In this theoretical scenario (we do not want to implement this in reality), your task is to tell us what solutions you would work with to create the frontend to fulfill the MVP requirements (frameworks/principles/structure). The more detail the better. The requirements for the minimal viable product would be:

- a visitor can see a list of all offers ordered by votes
- a visitor can see details of a specific offer
- a user can up/downvote the offers
- a user can purchase an offer using our existing platform
- we want to enter the market as soon as possible. Therefore, we aim to have a minimal product and only support desktop users

Please note that over the time of the scenario we will build up upon your imaginary stack
